

Book 4 outline v3: Monopolie, marktfalen en arbeidsmarkt

Date: 15 September 2026. **Revision:** book34-lesson-balance-v3-20260915. **Audience:** fourth-year VWO economics.

Status: owner-adopted v3 placement and authoring scope; implemented in the accompanying local edition. The owner accepted the split, the cross-book long-run transfer, the collective-agreement deferral and the revised chapter titles/budgets. This is not a claim of repository integration, independent target approval or measured classroom timing.

Supersedes for this edition: the 6 September v2 outline's allocation and affected specifications. Retain unchanged content and scope; do not automatically import all earlier target labels or approvals by number. Provenance and migration instructions are in the [decision and migration note](#).

Book-level decision

Retain **17 paragraphs**, now **5 + 7 + 5**. Rename Chapter 4.1 **Van concurrentie naar monopolie** and open with the long-run competitive outcome moved from Book 3. Then keep the full monopoly sequence. Chapter 4.2 stays at seven paragraphs. Chapter 4.3 loses the collective-bargaining/agreement-policy lesson, but retains participation, unemployment, productivity, equilibrium, minimum wages and its mixed lesson.

The new organising sequence is **Can competitive profit persist? → What changes when entry is restricted? → How does a monopolist choose? → What are the welfare effects? → How do familiar markets translate to labour?** Monopoly need not be profitable: entry barriers prevent a particular adjustment mechanism, but actual profits still depend on demand and costs.

The cover-level book title can remain unchanged: competition is an explicit bridge into monopoly, not a new fourth chapter or a reason to redesign the cover. The chapter title and contents must identify that bridge accurately.

Chapter	Title	Lessons	Student chapter page budget
4.1	Van concurrentie naar monopolie	5	50 maximum, accepted with the v3 proposal. The revised student chapter contains 48 pages.
4.2	Marktvormen en marktfalen	7	Retain the already allowed 60 maximum; no new eight-lesson chapter.
4.3	Arbeidsmarkt	5	Retain the already allowed 50 maximum; expect a reduction, not a requirement to fill the allowance.

A page transfer is not a new lesson. The final page counts are recorded in the accompanying book-page map; no print-cost saving is inferred from page counts. Answers remain outside these ceilings.

Lesson map

Paragraph	Title	Main change
4.1.1	Toetreding, uittreding en langetermijnevenwicht	Moved from former 3.2.3
4.1.2	Monopolie: kenmerken	Renumbered; bounded transition/reference edits
4.1.3	Marginale opbrengst bij monopolie	Renumbered; bounded transition/reference edits
4.1.4	Winstmaximalisatie bij monopolie	Renumbered; bounded transition/reference edits
4.1.5	Gemengde opgaven: concurrentie en monopolie	Renumbered; bounded transition/reference edits
4.2.1	Welvaartseffecten van monopolie	Retained
4.2.2	Prijsdiscriminatie	Retained
4.2.3	Marktvormen vergelijken	Retained
4.2.4	Negatieve externe effecten	Retained
4.2.5	Positieve externe effecten	Retained
4.2.6	Overheidsingrijpen bij marktfalen	Retained
4.2.7	Gemengde opgaven: marktvormen en marktfalen	Retained
4.3.1	Arbeidsvraag en arbeidsproductiviteit	Retained
4.3.2	Arbeidsaanbod, participatie en evenwicht	Retained
4.3.3	Werkloosheid en veranderingen op de arbeidsmarkt	Retained
4.3.4	Minimumloon	Retained
4.3.5	Gemengde opgaven: arbeidsmarkt	Former 4.3.6; deferred goals removed

Working design rules

Future paragraphs are designed around the complete supported normal route within 55 minutes. Existing books retain their exercises and goals: report genuine timing conflicts and plan additional lesson time instead of claiming an unsupported fit. The Year 1 allocation remains $12 + 12 + 14 + 17 = 55$; this is a curriculum count, not a classroom timing certificate.

Use the canonical Part A exercise contract for section roles, the normal and challenging routes, printed guidance and timing. Mixed paragraphs retain their existing consolidation structure without new theory; document the exception and use their actual support and sections. Preserve paper-first teaching, appropriate Dutch for 4 vwo, explicit units and capacity assumptions, source-supported conclusions and genuine visual support.

Use the existing delivered text, examples, targets and answers as the starting material. Change what the approved lesson boundary requires; do not rebuild valid paragraphs merely because an old registry contains a placeholder. For every changed target, map observable operations to teaching, practice and an answer model. Review the target's actual mathematics, economic assumptions and assessment coverage before final adoption; the book's existence alone is not approval.

Estimate actual reading, drawing, calculation and explanation steps alongside instruction, example, transitions and feedback. Follow the canonical route contract when including support and bonus time. Keep detailed estimates teacher-facing and identify incomplete older estimates explicitly.

The overloads identified in F08 remain open. The route amendment also exposes estimates that omitted guided practice. No split, merger, exercise deletion or goal deferral is authorised by this revision; preserve the targets and report the additional time or missing evidence.

The outline specifies the intended scope and sequence. The delivered manuscripts and PDFs specify the existing content to preserve. During this bounded revision, older blueprint placement and placeholder target records are **migration inputs**, not instructions to reverse the selected design. A brief transition note must name the revision and scope before implementation. External requirements, mathematical correctness, protected-source rules and publication/merge permissions are not overridden. Synchronise derived records before declaring the new edition integrated/current.

Deferred labour goals and retained learning

Move out of Year 1	Keep in the retained labour chapter
Negotiating parties, collective-agreement coverage and collective-bargaining explanation	Employer/household roles, labour supply/demand and specified labour units
Full agreement/training-policy comparison, including additional training costs and its decision criterion	Output/hours/productivity and basic unit labour cost; data-limited employment conclusions already taught in §4.3.1
Extra flexwork/zzp terminology introduced only for the removed source	Participation, unemployment denominators/causes, baseline and changed equilibrium
The removed lesson's standalone index-ratio presentation as an additional assessed routine	Earlier taught percentage and direct before/after ratio calculations, where already within retained targets

Do not interpret 'labour-market policy deferred' as removing minimum wages: §4.3.4 remains. Preserve the removed material under its former edition identity and give it a later-year destination decision. A change of ID never establishes target equivalence.

Chapter 4.1 – Van concurrentie naar monopolie

Organising question: When does profit attract competitors, and what changes when entry is restricted?

Start with the competitive long-run benchmark, then contrast it with an entry barrier and the monopoly demand constraint. This is a thematic bridge, not the claim that a perfectly competitive industry automatically evolves into monopoly. The new first lesson completes competitive analysis while retrieving the firm's calculation method after the intervening trade chapter.

Entry prerequisites: revised Book 3 §§3.2.1–3.2.4; Book 2 cost/revenue/surplus meanings. Differentiate the derivative reference (§3.2.2) from the optimum reference (§3.2.3). Normal remuneration/economic profit and formal long-run adjustment are new in §4.1.1.

Exit and timing: retain monopoly revenue and optimisation as distinct lessons, followed by one mixed lesson. Monopoly welfare stays immediately in §4.2.1. The relocated long-run lesson cannot include a full additional competitive review set; re-use its existing start/example route. Earlier timing risks for monopoly MR/optimisation remain review matters, not automatic extra lessons.

4.1.1 Toetreding, uittreding en langetermijnevenwicht

Role: Theory and application; moved from former §3.2.3, not a new extra curriculum goal.

Intended learning: Explain profit → entry → market supply → price → firm profit, and the exit direction under sustained losses. Connect market Q and firm q, represent the direction of adjustment, and calculate or verify the stated long-run firm outcome. Interpret zero economic profit when normal entrepreneurial remuneration is included in costs.

Retrieval and transfer: Reactivate Book 3's price-taking output choice, derivative and profit rectangle through the existing start/example route. Retrieve market supply shifts from Book 1. This first lesson of Book 4 teaches the new time-horizon and economic-profit interpretation; it is not an extra unnumbered recap lesson.

Target design brief: Preserve the delivered 'Standaard koffiebonen' target and valid answer model from former §3.2.3 as the main candidate. Use initial firm data, state entry/exit and cost assumptions, explain and represent the adjustment, identify the long-run price/output from the supplied minimum-GTK evidence, and verify TO = TK. Include the explanation that normal remuneration is still paid. Keep the opposite exit direction in appropriate independent practice. Material from old §3.2.4's three-moment case is available for selection or replacement, not an additional compulsory target stacked onto the lesson.

Visual teaching plan: A compact market-to-firm sequence: initial profit/loss, entry/exit, changed market price, and the resulting firm outcome. Use the existing paired diagrams and cost data. Explain why market output and one firm's output need not move together.

Boundary and review focus: Retain the stated free-entry/exit, identical active-firm costs and input-price assumptions. Under this model the endpoint is $P = MO = MK = \text{minimum GTK}$; it is not a universal claim about every real industry. Do not infer immediate shutdown from a short-period loss. End with the question 'What changes when other suppliers cannot enter?' as the transition to §4.1.2, not a complete additional monopoly lesson. The existing classroom-time estimate remains provisional and needs checking after the book-opening retrieval is selected.

v3 implementation: Relocate and lightly reconnect the existing paragraph, including its normal-remuneration explanation and target. Do not rewrite its valid model merely because its book and number changed.

4.1.2 Monopolie: kenmerken

Role: Theory and application.

Intended learning: Explain market power, barriers to entry and the relationship between the firm's sales and market demand.

Retrieval and transfer: Contrast with §3.2.1; retrieve the demand function and price/quantity relationship. Use a short retrieval task to restore the difference between a market graph and the competitive firm's graph before introducing the monopolist's graph. Connect the entry barrier explicitly to the adjustment mechanism taught in §4.1.1.

Target design brief: Use a source to identify the barrier to entry, distinguish monopoly from perfect competition and explain the price/quantity trade-off.

Visual teaching plan: Competitive and monopolist firm demand diagrams with matching actor labels.

Boundary and review focus: Monopoly does not mean unlimited pricing power. Patents can be one entry-barrier context; full policy evaluation belongs later.

v3 implementation: Move existing monopoly features to the second paragraph. Preserve the Eilandveer target; add only a short link from free entry to entry barriers. A monopoly may retain economic profit, but the source still has to establish its actual profitability.

4.1.3 Marginale opbrengst bij monopolie

Role: Theory and application.

Intended learning: Explain why extra sales and a lower price have different effects on total revenue; obtain MO from a simple TO relation.

Retrieval and transfer: Retrieve $TO = P \times Q$, Book 2 marginal differences and revenue interpretation, and the limited derivative technique taught in §3.2.2.

Target design brief: Move from a linear demand function to TO and MO, check the result against a short table, and explain why MO differs from the selling price.

Visual teaching plan: A revenue rectangle split into the gain on extra units and the reduction on existing units; aligned demand/MO curves.

Boundary and review focus: Assume a uniform selling price. Do not introduce point-elasticity formulas or a general calculus chapter. Revisit elasticity qualitatively only where it supports the taught revenue interpretation.

v3 implementation: Renumber only in substance: the derivative is now independently taught in Book 3 §3.2.2. Preserve the interval/point revenue explanation, uniform-price assumption and Prisma target.

4.1.4 Winstmaximalisatie bij monopolie

Role: Theory and application.

Intended learning: Determine output using MO and MK, then read price from demand and calculate profit.

Retrieval and transfer: Repeat §3.2.3's optimisation procedure, §4.1.3's revenue relation and Book 2 cost calculations.

Target design brief: Calculate the feasible monopoly output, corresponding selling price and total profit, then reject a common wrong-method claim using the calculation.

Visual teaching plan: A numbered visual route: $MO = MK \rightarrow \text{quantity} \rightarrow \text{demand/GO} \rightarrow \text{price} \rightarrow \text{profit}$.

Boundary and review focus: Do not read price from the MO curve, equate P with MK at the monopoly optimum, or confuse maximum revenue with maximum profit. Reserve the formal welfare comparison for §4.2.1, immediately after this chapter; it is not postponed to a later book.

v3 implementation: Preserve the valid monopoly optimisation target and its answers. Update the prior optimum reference to Book 3 §3.2.3 and the revenue reference to new §4.1.3.

4.1.5 Gemengde opgaven: concurrentie en monopolie

Role: Consolidation; no new theory.

Intended learning: Choose and execute the monopoly calculation sequence and compare it with the already-taught competitive firm sequence.

Retrieval and transfer: Interleave cost, revenue, elasticity interpretation, break-even and marginal choice without adding new operations.

Target design brief: Use a monopoly case with sources and a compact competitive contrast; explain why the correct price-reading step differs.

Visual teaching plan: A firm graph plus a cost/revenue source; students supply the missing labels or steps required by the target.

Boundary and review focus: No price discrimination, strategic game or monopoly-welfare target before those are taught. Consolidation is not an extra theory paragraph.

v3 implementation: Reuse Kleurfix and the separate competitive case. A compact contrast about entry may retrieve new §4.1.1, but it must replace comparable work rather than add an entire second long-run target. Keep the same one-lesson core and avoid claiming all competitive/monopoly comparisons hold other market conditions constant.

Chapter 4.2 – Marktvormen en marktfalen

Organising question: When does a market outcome fail to maximise the relevant welfare measure, and what can policy change?

Retain the seven existing paragraph purposes and IDs. Monopoly welfare, group pricing, classification, both externality directions, policy comparison and mixed work remain. The more extensive externalities reallocation discussed previously is **not** adopted in this minimal revision.

Entry prerequisites: revised Chapter 4.1, Book 2 surplus/costs, Chapter 3.1 interventions and Book 1 representations. Labour is not a prerequisite. Monetary/fiscal macro models and formal games are not introduced.

Timing status: F08 remains open for §§4.2.4–4.2.5, whose delivered selected cores are estimated at 64 minutes, and warrants attention in price discrimination. This outline does not cure those estimates by restating 55. Retain the social ledger and essential independent loss-area evidence; target-specific route redesign or an explicit further owner trade-off is needed if the core cannot fit.

4.2.1 Welvaartseffecten van monopolie

Role: Theory and application.

Intended learning: Compare monopoly with an appropriate competitive/efficient benchmark and distinguish a redistribution of surplus from a welfare loss.

Retrieval and transfer: Repeat §4.1.4's quantity-and-price calculation and Book 2 CS/PS/total-surplus areas as essential parts of the current task.

Target design brief: Determine both benchmark quantities, calculate or identify the surplus distribution and lost gains from trade, and explain why higher producer returns are not identical to higher total welfare.

Visual teaching plan: One demand/MO/MK diagram with both outcomes and a separate explanation of each shaded area.

Boundary and review focus: Keep demand, cost conditions and welfare boundary comparable across scenarios. Producer surplus is not automatically profit; do not treat every transfer between buyer and seller as a loss.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.2.2 Prijsdiscriminatie

Role: Theory and application.

Intended learning: Explain the conditions for selling at different prices and analyse the effect on revenue, profit and the division of surplus.

Retrieval and transfer: Reuse TO, profit and demand responsiveness; where the chosen target requires it, repeat the established MO/MK procedure in each explicitly separated market.

Target design brief: Compare uniform pricing with a bounded two-group pricing case using supplied demand/cost evidence; explain one feasibility condition and one distributional effect.

Visual teaching plan: Two clearly separated demand panels or a two-group source table; a comparison of price, sales and surplus.

Boundary and review focus: State market separation and resale restrictions. For separate segment optimisation, use a stated common constant marginal cost, or explicitly account for costs that depend on combined output. Do not claim that discrimination necessarily raises or necessarily lowers total welfare. Avoid adding simultaneous unfamiliar cost structures and multiple optimisation cases.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.2.3 Marktvormen vergelijken

Role: Theory and application.

Intended learning: Distinguish perfect competition, monopolistic competition, oligopoly and monopoly; transfer a familiar profit procedure to a supplied unfamiliar-market representation.

Retrieval and transfer: Reuse competitive/monopoly reasoning, substitute relationships, demand responsiveness and marginal profit choice.

Target design brief: Classify firms from concise sources and apply the already-taught calculation to one appropriate supplied firm diagram or function; justify the classification and outcome.

Visual teaching plan: A compact comparison grid and one carefully selected firm-graph transfer.

Boundary and review focus: Do not assume an oligopolist has one universal demand curve. No reaction functions or payoff-matrix techniques here. Formal strategic interaction stays in the later course. This paragraph is not just a vocabulary checklist, but it also must not become four full new models.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.2.4 Negatieve externe effecten

Role: Theory and application.

Intended learning: Identify unpriced harm to third parties, distinguish private from social consequences and analyse a corrective tax.

Retrieval and transfer: Repeat the tax calculation from §§3.1.1-3.1.2, the market equilibrium method and surplus accounting. The external-cost interpretation is new.

Target design brief: Identify the affected third party, compare the unregulated and taxed outcome, calculate the taught market/budget consequences and use supplied external-cost evidence to evaluate welfare.

Visual teaching plan: A private/social-cost comparison linked explicitly to the familiar tax-wedge diagram; introduce each new line before using it.

Boundary and review focus: Do not count tax revenue as a real social loss or treat CS + PS alone as the full welfare measure when external harm is present. Keep external-cost assumptions explicit and simple; no unsupported claims of a uniquely optimal tax.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.2.5 Positieve externe effecten

Role: Theory and application.

Intended learning: Identify benefits to third parties and explain how a subsidy can improve an outcome with too little of the beneficial activity.

Retrieval and transfer: Repeat §3.1.3's subsidy wedge, quantity and government-expenditure calculation and Book 2 surplus reasoning.

Target design brief: Use an illustrative activity with a stated external benefit and subsidy rule. Calculate the new market outcome and public spending, then explain why the welfare conclusion differs from a subsidy without an external benefit.

Visual teaching plan: A labelled external-benefit diagram connected to the same subsidy representation already used in Book 3.

Boundary and review focus: Keep the benefit to the buyer separate from the benefit to others. State who receives the subsidy. Do not count a transfer twice or assume every subsidy is appropriately sized. The external-benefit interpretation is new teaching, not prerequisite recall.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.2.6 Overheidsingrijpen bij marktfalen

Role: Theory and application.

Intended learning: Match a policy to the diagnosed failure, compare feasible alternatives and evaluate effects and limitations with evidence.

Retrieval and transfer: Reuse taxes, subsidies, price restrictions and quantity restrictions, alongside monopoly and externality analysis.

Target design brief: Compare two policy proposals for one clearly described problem. Carry out one familiar calculation and use an explicit criterion to justify a qualified recommendation.

Visual teaching plan: A problem -> mechanism -> instrument -> outcome comparison, with a small numerical or graphical source.

Boundary and review focus: Not a second full course on every instrument. A patent/competition-policy example can retrieve market power; avoid importing the later games, insurance or macro-policy curriculum. Separate efficiency from distribution and recognise implementation limits stated in the source.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.2.7 Gemengde opgaven: marktvormen en marktfalen

Role: Consolidation; no new theory.

Intended learning: Integrate firm behaviour, surplus, external effects and policy selection without new theory.

Retrieval and transfer: Select useful methods from Books 1-3, Chapter 4.1 and §§4.2.1-4.2.6, rather than repeating a labelled routine mechanically.

Target design brief: Use contrasting short cases: at least one market-power case and one externality/policy case. The target requires numerical or graphical evidence and a bounded economic conclusion.

Visual teaching plan: Previously introduced diagram families with less scaffolding; make the required model choice visible in the answer model.

Boundary and review focus: Do not put an unfamiliar policy or welfare concept into the mixed target. Keep core work feasible; distribute additional retrieval to the closing review.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

Chapter 4.3 – Arbeidsmarkt

Organising question: How do familiar market methods work when price is a wage and households supply labour?

Keep five genuine lessons: four theory/application units and mixed work. This is the minimal deferral option, not the previously discussed four-lesson alternative. Participation and unemployment remain Year 1 goals, as do equilibrium, shifts, productivity and minimum wages.

Deferred: the standalone lesson on unions, cao, agreement/training-policy evaluation and its additional institutional/ratio presentation moves to the later-year planning queue. Do not squeeze it into the surviving lessons, mixed tasks or homework. Basic unit labour costs and source-bounded employment reasoning already taught in §4.3.1 stay.

Retained equilibrium evidence: baseline in §4.3.2; shifts and wage-adjustment conditions in §4.3.3; a non-clearing minimum wage in §4.3.4; independent integrated equilibrium/shift evidence in new §4.3.5. General household/employer roles and labour units remain explicitly introduced.

Later-year destination: Book 8 collective action/bargaining and later macro wage adjustment are candidate homes, not already funded placements. Record which later target will teach the deferred operations before treating them as prerequisites. This deferral is not a claim that the material is absent from the final course or unnecessary for an examination.

4.3.1 Arbeidsvraag en arbeidsproductiviteit

Role: Theory and application.

Intended learning: Explain why employers demand labour, interpret changes in that demand, and relate output, labour input, productivity and labour cost per unit.

Retrieval and transfer: Retrieve demand shifts, average-cost reasoning, ratios and percentages. Re-label price as wage and show that employers are the buyers of labour.

Target design brief: Use a firm or sector source to calculate productivity or required labour and labour cost per product, then explain a movement along or shift of labour demand.

Visual teaching plan: A goods-market/labour-market comparison plus a labelled output -> labour-input calculation table. A short source about export orders or import competition can retrieve Chapter 3.3 while changing only the labour-demand interpretation.

Boundary and review focus: Keep hours, persons and full-time equivalents distinct. Do not imply productivity growth always reduces total employment; state output and other conditions. No formal marginal-revenue-product optimisation unless separately justified and taught. This is the first formal home of the productivity and unit-labour-cost calculations; revisit a qualitative competitiveness claim from §3.3.1 only after teaching the needed calculation here.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.3.2 Arbeidsaanbod, participatie en evenwicht

Role: Theory and application.

Intended learning: Identify households as labour suppliers, calculate participation with the stated denominator, and find and interpret the competitive baseline equilibrium wage and employment.

Retrieval and transfer: Reuse Book 1 equilibrium equations and graph reading. A short explicit translation bridge precedes one compact equilibrium calculation; the algebra is not retaught as new.

Target design brief: Read a population/participation source and a separate simple market model. Calculate the specified participation measure, then equilibrium wage and quantity, and explain who supplies and who demands labour.

Visual teaching plan: A small population composition scheme and paired generic-market/labour-market graphs with identical mathematical structure.

Boundary and review focus: This paragraph absorbs the baseline part of the registry-baseline §4.2.3, not an entire extra lesson hidden inside it. Keep participation data simple, units fixed and the equilibrium model familiar. Distinguish a supply curve at different wages from measured labour-force totals. Review timing before finalising the target.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.3.3 Werkloosheid en veranderingen op de arbeidsmarkt

Role: Theory and application.

Intended learning: Calculate unemployment using the labour force as denominator, distinguish the relevant causes and interpret labour-market changes.

Retrieval and transfer: Reuse §4.3.2's equilibrium and Book 1 shift/new-equilibrium method. This is the second home of the absorbed equilibrium work.

Target design brief: Combine a compact labour-market source with one shift scenario: calculate unemployment, identify the cause and explain the direction of wage/employment pressure under stated adjustment assumptions.

Visual teaching plan: A labour-force composition table alongside one before/after labour-market graph.

Boundary and review focus: Distinguish the simplified clearing model from observed vacancies and mismatch. With data defined as labour demand = employment + vacancies, supply minus demand is not measured unemployment. Explain structural/frictional and demand-related unemployment at an introductory level; no output-gap or Phillips-curve model.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.3.4 Minimumloon

Role: Theory and application.

Intended learning: Apply a minimum-price model to wages and distinguish effects on wage rates, employment, people seeking work and the wage bill.

Retrieval and transfer: Repeat §3.1.5's price-floor technique and §4.3.2's labour-market translation; reuse price-times-quantity and percentage calculations.

Target design brief: Determine whether a minimum wage binds, calculate the taught model outcomes and wage bill, and explain the difference between workers who retain employment and those who do not obtain work.

Visual teaching plan: A price-floor/minimum-wage pair with the same analytical steps and changed labels.

Boundary and review focus: State a competitive model, the wage unit and adjustment assumptions. Model outcomes are not universal empirical claims about every minimum-wage change. Use illustrative rates, not unverified current statutory figures.

v3 implementation: Retain the delivered teaching and target by default; update only affected references and any separately justified repair.

4.3.5 Gemengde opgaven: arbeidsmarkt

Role: Consolidation; no new theory. Renumbered and narrowly revised from former §4.3.6.

Intended learning: Combine labour-market actors and units, productivity and basic unit labour costs, participation/unemployment denominators, baseline equilibrium, shifts and a minimum-wage model. Give conclusions bounded by the supplied data and assumptions, without requiring collective bargaining or the deferred agreement/training-policy framework.

Retrieval and transfer: Retrieve only retained §§4.3.1–4.3.4 and earlier familiar market methods. Keep independent equilibrium/shift evidence so that shortening the chapter does not silently remove it. General claims about employment still require both labour-productivity and output information, as taught in §4.3.1.

Target design brief: Reuse the Havenregio regional count and separate sector-model sources. Preserve independent old/new wage and employment calculations and the supply-movement/demand-shift distinction. Retain basic unit-labour-cost calculations where taught in §4.3.1. Rewrite the training/collective-agreement framing as a bounded firm-output/productivity case; do not require negotiating parties, cao coverage, training-cost policy comparison or the former §4.3.5's additional institutional knowledge. One qualified jobs conclusion can remain when its full reasoning was taught in the retained paragraphs.

Visual teaching plan: The existing separate population table and wage/quantity graph remain useful. A compact firm-data source should be clearly distinct from the regional count. Avoid turning their juxtaposition into a claim that they measure the same labour market.

Boundary and review focus: In old mixed exercise 48, replace the cao wage floor by a clearly stated illustrative minimum wage, or select another already-taught wage-floor case. Remove or revise old 49's source C and 49f only to the extent needed by the retained goals; do not delete the useful data-limited employment reasoning already in §4.3.1. Update the final return-reference to old §4.3.5. The new numeric ID 4.3.5 is a mixed paragraph, not the old bargaining paragraph. Deferred goals must not return in compulsory homework, tests or an unexplained bonus.

v3 implementation: Keep a complete mixed lesson. The saved lesson comes from genuinely deferring old §4.3.5, not from compressing its goals into this paragraph. The current lesson count is five, not four.

Implemented edition: exact target locators

The following are actual exercises and answer models in the delivered v3 manuscripts, not structural placeholders. Formal independent target review is recorded separately; no inherited approval is asserted.

Paragraph	Target exercise	Student chapter page(s)	Candidate record
4.1.1	7	10	record
4.1.2	18	18	record
4.1.3	28	29	record
4.1.4	38	40	record
4.1.5	45	44–45	record
4.2.1	7	9	record
4.2.2	16	17	record
4.2.3	25	23	record
4.2.4	34	34	record
4.2.5	43	45	record
4.2.6	52	51	record
4.2.7	58	56–57	record
4.3.1	7	10	record
4.3.2	16	18	record
4.3.3	25	27	record
4.3.4	34	35	record
4.3.5	40	40–41	record
